TECHNICAL SCRUTINY AND ENVIRONMENTAL IMPACT ASSESSMENT BY DEAC

The proposal was placed in the 20th DEAC meeting held on 06/04/2018. (Reference 2). The committee appraised the proposal and decided to defer the item for field visit by the sub committee concerned. The DEAC sub committee visited the Quarry project site of Sri Sabu Varghese, M/s S.S. Granites, Palakkuzha Village and Muvattupuzha Taluk and submitted the report to DEAC.

The field inspection details as reported by DEAC (Reference 3).

The proposed quarry is located between north latitudes 9^o53'59.66" and 9^o54'06.93" and east longitudes 76^o35'44.49" and 76^o35'56.15". Geologically the area is occupied by hard crystalline rocks representing Precambrian metamorphosed rocks. The applied area forms the upper side slope portion of a hilly terrain which, in general, slopes towards north-west. The reported highest elevation of the applied area is 170m AMSL and lowest is 110m AMSL. This proposal corresponds to a fresh quarry i.e., the applied area is virgin and the major portion is occupies by mixed crops. Rock exposures comprises of complex associates of charnockites, quartz, feldspathic and biotite gneiss. The overburden thickness averages about 1m to 2m. (Reference 3).

The inspection team, in general, looked into the impacts on eco-system, flora, fauna, soil, land form, air quality etc, which are likely to alter with the onset of quarrying operations. The potential for natural hazards such as landslides, surface creep, erosion, flooding or any adverse environmental conditions during the time of mining are ruled out, provided if mining is carried out in accordance with the approved mining plan. (Reference 3).

Groundwater generally occurs under phreatic conditions in weathered and fractured crystalline rocks and laterite. It occurs under semi-confined conditions in the deep seated fractured aquifer of the crystalline rocks and tertiary sediments. The geologic zone important to ground water is identified in terms of water holding and water yielding capabilities. Porous granular formations like laterite, weathered and decomposed crystalline rocks as well as fissures, joints and fractures in crystalline rocks constitute the main water-bearing formations. The water table is below 4m-5m from general ground level as observed from an open well located 150 meters further north from the applied area. (Reference 3).

There are no perennial water courses or streams within the applied area. The rain water passes as minor water courses through natural geographic slope and joins the local water bodies forming dendritic drainage pattern. The proposed site does not possess any valuable resources other than granite

building stone. The revenue official present at the time of inspection reported that the area is not under any legal procedures. (Reference 3).

Considering all the aspects the DEAC approved the mining project and recommended DEIAA to grant Environmental Clearance. (Reference 3).

DEIAA DECISIONS

As per DEAC recommendation, DEIAA considered the project proposal. The applicant submitted detailed CSR and remitted Rs. 1, 00,000/- (Rupees One Lakh Only) as processing fee vide chalan no. KL010394902201718M dt. 02/02/2018 of District Treasury, Ernakulam.
